---------	---	---

ABSTRACT

The objective of the 2004/2005 Nechako River Flow Control Project was to ensure effective release of the Annual Water Allocation (AWA), as defined in the 1987 Settlement Agreement (Anon. 1987) (a mean release of $36.8 \text{ m}^3/\text{s}$ at Skins Lake Spillway with the intent of achieving a mean annual flow of $41.7 \text{ m}^3/\text{s}$ in the Nechako River below Cheslatta Falls). The recorded mean annual Skins Lake Spillway release was $57.6 \text{ m}^3/\text{s}$, and the mean annual flow in the Nechako River below Cheslatta Falls was recorded at $64.0 \text{ m}^3/\text{s}$. Excluding summer cooling water releases, the calculated mean annual Skins Lake Spillway release attributable to the AWA was $37.3 \text{ m}^3/\text{s}$.

INTRODUCTION

The 1987 Settlement Agreement (Anon. 1987) specifies the Annual Water Allocation (AWA) to be released from Nechako Reservoir. The AWA is specified as a mean annual release of $36.8 \text{ m}^3/\text{s}$ at Skins Lake Spillway with the intent of achieving an approximate mean annual flow of $41.7 \text{ m}^3/\text{s}$ in the Nechako River below Cheslatta Falls.

This report provides a summary of available mean monthly and mean daily Skins Lake Spillway releases and flows in the Nechako River below Cheslatta Falls for the period April 1, 2004 to March 31, 2005.

Nechako River below Cheslatta Falls. Data presented in the report for the period April 1, 2004 to March 31, 2005 include preliminary Water Survey of Canada (WSC) data for both locations, and a short period of estimated flow data for the Nechako River below Cheslatta Falls. These latter data were estimated by Triton Environmental Consultants Ltd. (Triton) for the period January 1 to February 10, 2005 when the flows recorded were affected by river ice and had not been adjusted by the Water Survey of Canada (WSC) prior to the preparation of this report. Therefore, these estimated data may vary slightly from the published WSC data for this period.

Skins Lake Spillway releases are made by Alcan in response to direction received from the NFCP Technical Committee and are based on the current reservoir water surface elevation and anticipated reservoir inflow. On April 1 (the start of the NFCP water year) of each year, the spillway release is typically maintained at the winter release from the previous year. Later in April, the release is increased to the current year spring release (typically $49.0 \text{ m}^3/\text{s}$), with the timing being dependent on downstream ice conditions in the Cheslatta and Murray Lakes system. Following this increase to the spring release, and during ice-free conditions, the spillway settings are reviewed periodically, typically weekly, to ensure the requested releases are achieved. In mid to late August, following completion of the Summer Water Temperature and Flow Management Project (Triton 2005), the

OBJECTIVE AND RATIONALE

The objective of the Nechako River Flow Control Project is to ensure release of the AWA. This objective is to be achieved by scheduling Nechako Reservoir releases appropriately to ensure the water allocation is utilized. Direction on the rate, timing and duration of Skins Lake Spillway releases is provided to Alcan Primary Metal Group (Alcan) by the Nechako Fisheries Conservation Program (NFCP) Technical Committee.

DATA REQUIREMENTS AND PROJECT OPERATIONS

Project data requirements include mean daily Skins Lake Spillway releases and mean daily flows in the

spillway release is reduced to achieve the winter flow regime. During winter conditions, the gate setting is also adjusted periodically to ensure the average winter release, as established by the NFCP, is achieved.

The above release regime is termed the “operational release”, and is defined as the WSC recorded release made by Alcan, less forced spills and additional flows as required for cooling purposes, as per the 2005 Summer Water Temperature and Flow Management Project.

RESULTS

A comparison of Settlement Agreement and operational mean monthly Skins Lake Spillway releases is presented in Figure 1. Releases presented in Figure 1 include an increase in the spillway release

from the previous year's winter release to approximately $49.0 \text{ m}^3/\text{s}$ initiated on April 24, 2004, and a spillway release reduction to the winter flow regime initiated on August 18, 2004. The mean annual operational release for the 2004/2005 water year was $37.3 \text{ m}^3/\text{s}$. The Settlement Agreement AWA specifies a mean annual release of $36.8 \text{ m}^3/\text{s}$. The difference between the operational release and the specified $36.8 \text{ m}^3/\text{s}$ is due to the nature of the spillway gate setting schedule in response to changing reservoir water surface elevations.

A comparison of Settlement Agreement and available recorded mean monthly flows in the Nechako River below Cheslatta Falls is presented in Figure 2. The Settlement Agreement AWA specifies an approximate mean annual flow of $41.7 \text{ m}^3/\text{s}$ in the Nechako River below Cheslatta Falls (plus additional flows as required for cooling purposes).

Figure 1. Comparison between Settlement Agreement and Operational Skins Lake Spillway Releases, April 2004 to March 2005

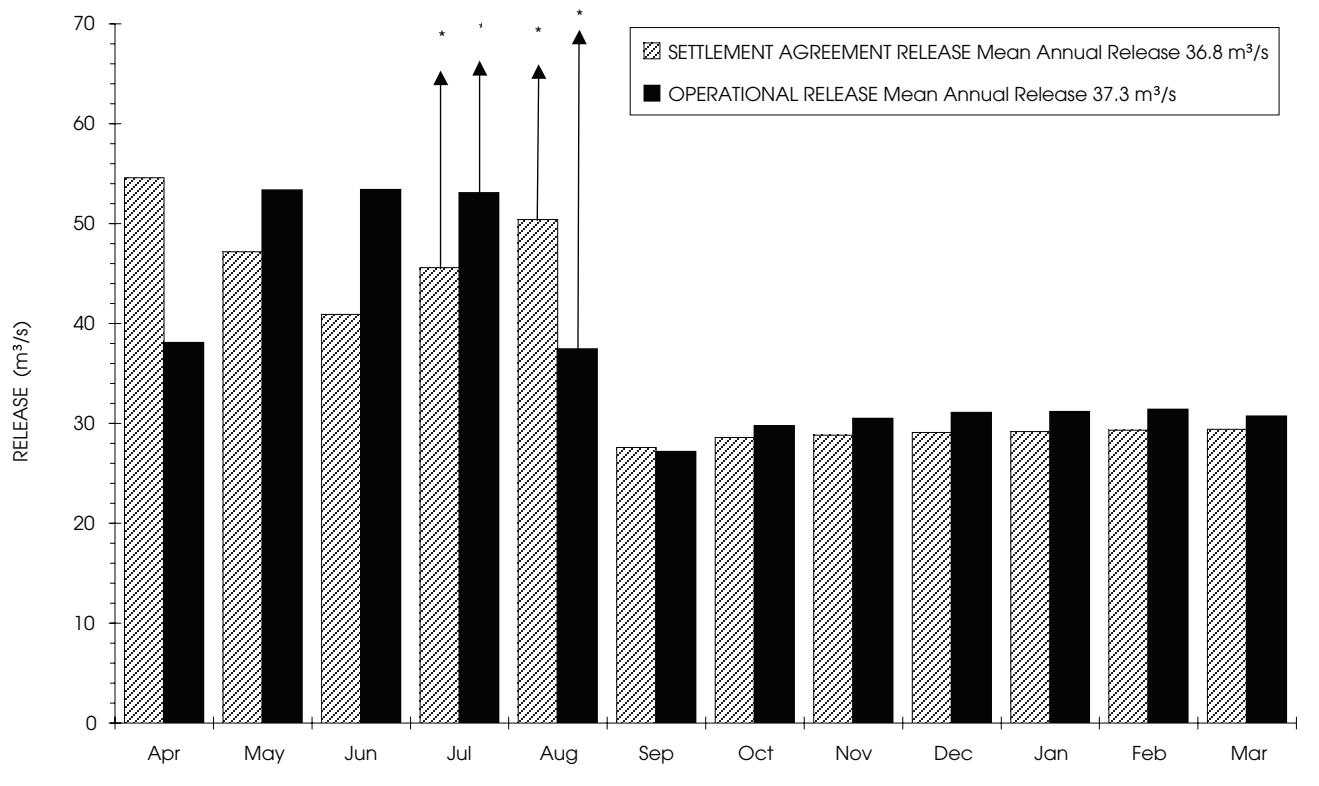

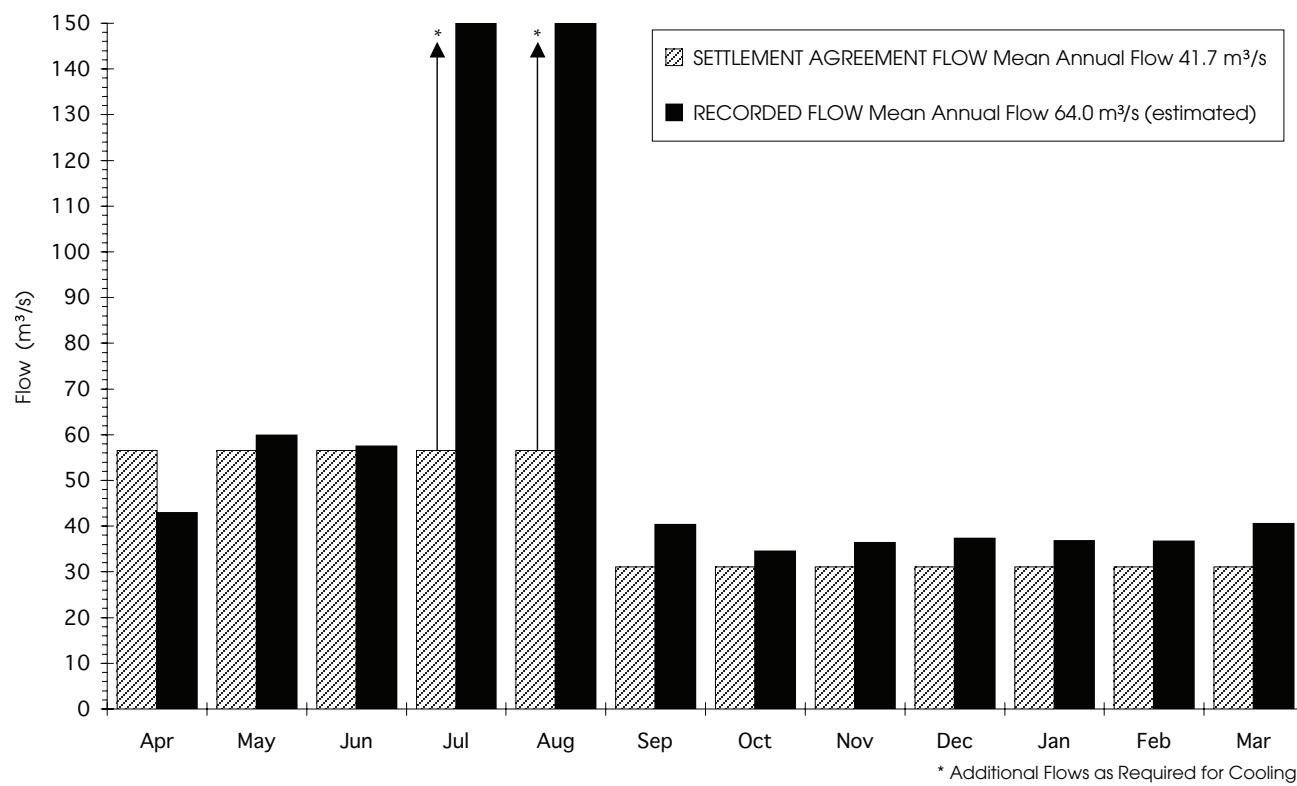

Figure 2. Comparison between Settlement Agreement and Recorded Flow in Nechako River below Cheslatta Falls, April 2004 to March 2005

Recorded mean daily Skins Lake Spillway releases and flow in the Nechako River below Cheslatta Falls for the 2005/2006 water year are presented in Table 1. The recorded mean annual Skins Lake Spillway release (including summer cooling water releases and spills) was $57.6 \text{ m}^3/\text{s}$. The recorded mean annual flow in the Nechako River below Cheslatta Falls was $64.0 \text{ m}^3/\text{s}$.
